PROGIBOX

Proginov has created ProgiBox to provide maximum availability.

ProgiBox lets you connect to more than one network operator, thus providing close to 100% availability while optimising incoming and outgoing traffic.

// Multihoming

- Your site is connected to multiple operators
- 3G/4G backup mode via VPN
- Management of incoming and outgoing traffic

// Bandwidth optimisation and management

- Management of several service type levels and bandwidth priorities
- Optimum use of available bandwidth to provide the best throughput at all times

// Limitation of operator down-time

- Seamless switchover to the available network in just seconds if one of your operators' lines goes down

// Filtered applications

- Assignment of one operator to each application, with maximum bandwidth on the line dedicated to the most sensitive applications and secondary applications grouped together on another line, balancing the load

// Auto-configuration

- Automatic reconfiguration of ProgiBox (with minimum setup) by searching for the latest version of the configuration file on a remote FTP server
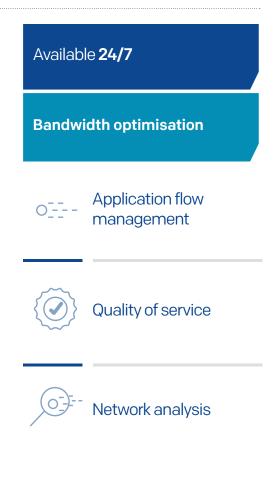

// Delegation of admin profile

- Delegation of administration tasks by managing user profiles
- Direct access to your network information on ProgiBox

// Web management interface

- Easy to configure options via a web interface (configure IP addresses, filtering and monitoring rules, log, log-in histories, etc.)

// Network analysis tools

- Detection of dysfunctions and unusual behaviour of your local network (virus, spyware, misconfigured workstations, etc.)

Available **24/7**
